

**EXHIBIT 10**  
**UNITED STATES PATENT NO. 11,805,267**  
**CLAIM CHART FOR INFRINGEMENT OF CLAIM 19 BY HISENSE ACCUSED PRODUCTS**

As demonstrated in the chart below, Hisense directly and indirectly infringes at least claim 19 of US 11,805,267 (the “’267 Patent”). Hisense directly infringes, contributes to the infringement of, and/or induces infringement of the ’267 Patent by making, using, selling, offering for sale, and/or importing into the United States the Accused Products that are covered by one or more claims of the ’267 Patent. The Accused Products are devices that decode H.265-compliant video. For example, The Hisense 43A7N is a representative product for other Hisense devices that decode H.265-compliant video.

The Hisense 43A7N contains at least one video decoder that helps decode H.265-compliant video.<sup>1</sup> While evidence from the Hisense 43A7N is specifically charted herein, the evidence and contentions charted herein apply equally to the other Hisense Accused Products that decode H.265-compliant video.

No part of this exemplary chart construes, or is intended to construe, the specification, file history, or claims of the ’267 Patent. Moreover, this exemplary chart does not limit, and is not intended to limit, Nokia’s infringement positions or contentions.

The following infringement chart includes exemplary citations to ITU-T Rec. H.265 (12/2016) High efficiency video coding (available at <https://www.itu.int/rec/T-REC-H.265-201612-S/en>) (the “H.265 Standard”). The cited functionality has been included in editions of the H.265 Standard since April 2013 and remains in current editions of the H.265 Standard. Any Hisense device that includes a decoder that practices the functionality in any of these editions of the H.265 Standard practices (“H.265 Decoder”) the claims of the ’267 Patent. Thus, the Accused Products each practice the H.265 Standard and are covered by claims of the ’267 Patent.

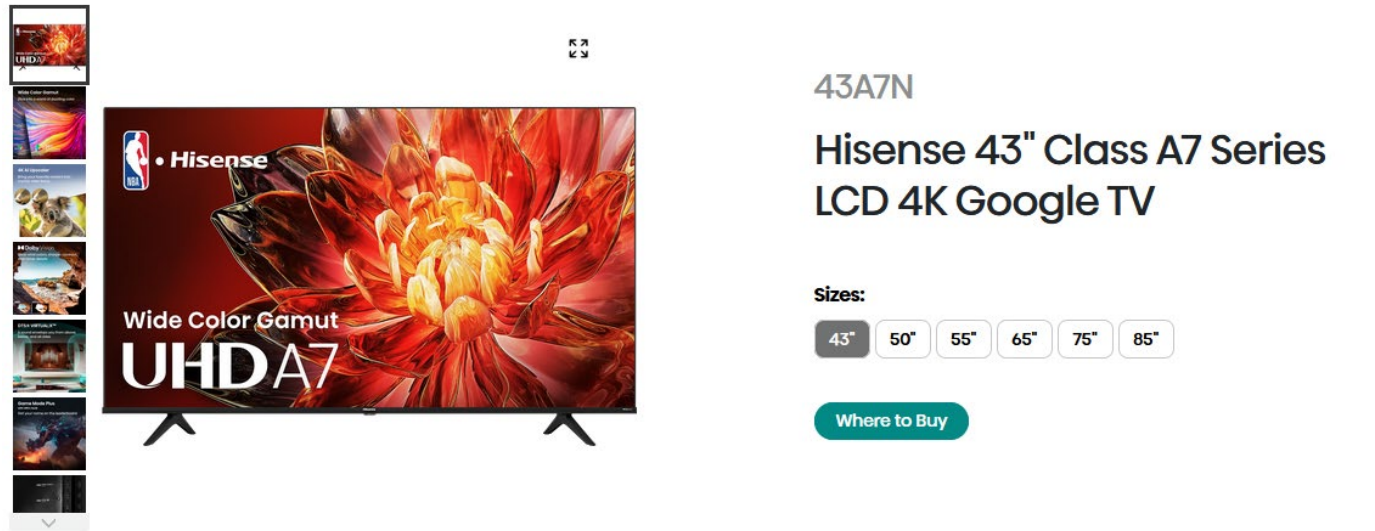

Nokia contends each of the following limitations is met literally, and, to the extent a limitation is not met literally, it is met under the doctrine of equivalents.<sup>2</sup>

**EXHIBIT 10**  
**UNITED STATES PATENT NO. 11,805,267**  
**CLAIM CHART FOR INFRINGEMENT OF CLAIM 19 BY HISENSE ACCUSED PRODUCTS**

U.S. PATENT NO. 11,805,267	HISENSE ACCUSED PRODUCTS
	<p data-bbox="625 289 1176 316"><b>5.10 Variables, syntax elements and tables</b></p> <p data-bbox="625 337 1848 451">Syntax elements in the bitstream are represented in <b>bold</b> type. Each syntax element is described by its name (all lower case letters with underscore characters), and one descriptor for its method of coded representation. The decoding process behaves according to the value of the syntax element and to the values of previously decoded syntax elements. When a value of a syntax element is used in the syntax tables or the text, it appears in regular (i.e., not bold) type.</p> <p data-bbox="611 505 1470 537">ITU-T Rec. H.265 (12/2016) High efficiency video coding at p. 18.</p> <p data-bbox="625 586 1801 613"><b>6.3 Partitioning of pictures, slices, slice segments, tiles, coding tree units and coding tree blocks</b></p> <p data-bbox="625 639 1346 667"><b>6.3.1 Partitioning of pictures into slices, slice segments and tiles</b></p> <p data-bbox="625 683 1848 797">This clause specifies how a picture is partitioned into slices, slice segments and tiles. Pictures are divided into slices and tiles. A slice is a sequence of one or more slice segments starting with an independent slice segment and containing all subsequent dependent slice segments (if any) that precede the next independent slice segment (if any) within the same picture. A slice segment is a sequence of coding tree units. Likewise, a tile is a sequence of coding tree units.</p> <p data-bbox="625 818 1848 932">For example, a picture may be divided into two slices as shown in Figure 6-4. In this example, the first slice is composed of an independent slice segment containing 4 coding tree units, a dependent slice segment containing 32 coding tree units and another dependent slice segment containing 24 coding tree units; and the second slice consists of a single independent slice segment containing the remaining 39 coding tree units of the picture.</p> <p data-bbox="611 980 1470 1013">ITU-T Rec. H.265 (12/2016) High efficiency video coding at p. 23.</p> <p data-bbox="625 1062 1008 1089"><b>7 Syntax and semantics</b></p> <p data-bbox="625 1110 1251 1138"><b>7.1 Method of specifying syntax in tabular form</b></p> <p data-bbox="625 1159 1848 1208">The syntax tables specify a superset of the syntax of all allowed bitstreams. Additional constraints on the syntax may be specified, either directly or indirectly, in other clauses.</p> <p data-bbox="659 1224 1848 1300">NOTE – An actual decoder should implement some means for identifying entry points into the bitstream and some means to identify and handle non-conforming bitstreams. The methods for identifying and handling errors and other such situations are not specified in this Specification.</p> <p data-bbox="625 1321 1848 1403">The following table lists examples of the syntax specification format. When <b>syntax_element</b> appears, it specifies that a syntax element is parsed from the bitstream and the bitstream pointer is advanced to the next position beyond the syntax element in the bitstream parsing process.</p>

ITU-T Rec. H.265 (12/2016) High efficiency video coding at pp. 164-65.

**8.5.3.3.3 Chroma sample interpolation process**

This process is only invoked when ChromaArrayType is not equal to 0.

Inputs to this process are:

- a chroma location in full-sample units (  $x_{IntC}$ ,  $y_{IntC}$  ),

**EXHIBIT 10**  
**UNITED STATES PATENT NO. 11,805,267**

**8.5.3.3.3 Chroma sample interpolation process**

This process is only invoked when ChromaArrayType is not equal to 0.

Inputs to this process are:

- a chroma location in full-sample units (  $x_{\text{IntC}}$ ,  $y_{\text{IntC}}$  ),

**EXHIBIT 10**

U.S. PATENT NO. 11,805,267	HISENSE ACCUSED PRODUCTS
	<p>block nPbH set equal to <math>nCbS_L \gg 1</math> and a partition index partIdx set equal to 0 as inputs, and the outputs are an <math>(nCbS_L) \times (nCbS_L)</math> array predSamples<sub>L</sub> and, when ChromaArrayType is not equal to 0, two <math>(nCbSw_C) \times (nCbSh_C)</math> arrays predSamples<sub>Cb</sub> and predSamples<sub>Cr</sub>.</p> <p>2. The decoding process for prediction units in inter prediction mode as specified in clause 8.5.3 is invoked with the luma location ( xCb, yCb ), the luma location ( xBl, yBl ) set equal to ( nCbS<sub>L</sub> &gt;&gt; 1, 0 ), the size of the luma coding block nCbS<sub>L</sub>, the width of the luma prediction block nPbW set equal to nCbS<sub>L</sub> &gt;&gt; 1, the height of the luma prediction block nPbH set equal to nCbS<sub>L</sub> &gt;&gt; 1 and a partition index partIdx set equal to 1 as inputs, and the outputs are the modified <math>(nCbS_L) \times (nCbS_L)</math> array predSamples<sub>L</sub> and, when ChromaArrayType is not equal to 0, the two modified <math>(nCbSw_C) \times (nCbSh_C)</math> arrays predSamples<sub>Cb</sub> and predSamples<sub>Cr</sub>.</p> <p>3. The decoding process for prediction units in inter prediction mode as specified in clause 8.5.3 is invoked with the luma location ( xCb, yCb ), the luma location ( xBl, yBl ) set equal to ( 0, nCbS<sub>L</sub> &gt;&gt; 1 ), the size of the luma coding block nCbS<sub>L</sub>, the width of the luma prediction block nPbW set equal to nCbS<sub>L</sub> &gt;&gt; 1, the height of the luma prediction block nPbH set equal to nCbS<sub>L</sub> &gt;&gt; 1 and a partition index partIdx set equal to 2 as inputs, and the outputs are the modified <math>(nCbS_L) \times (nCbS_L)</math> array predSamples<sub>L</sub> and, when ChromaArrayType is not equal to 0, the two modified <math>(nCbSw_C) \times (nCbSh_C)</math> arrays predSamples<sub>Cb</sub> and predSamples<sub>Cr</sub>.</p> <p>4. The decoding process for prediction units in inter prediction mode as specified in clause 8.5.3 is invoked with the luma location ( xCb, yCb ), the luma location ( xBl, yBl ) set equal to ( nCbS<sub>L</sub> &gt;&gt; 1, nCbS<sub>L</sub> &gt;&gt; 1 ), the size of the luma coding block nCbS<sub>L</sub>, the width of the luma prediction block nPbW set equal to nCbS<sub>L</sub> &gt;&gt; 1, the height of the luma prediction block nPbH set equal to nCbS<sub>L</sub> &gt;&gt; 1 and a partition index partIdx set equal to 3 as inputs, and the outputs are the modified <math>(nCbS_L) \times (nCbS_L)</math> array predSamples<sub>L</sub> and, when ChromaArrayType is not equal to 0, the two modified <math>(nCbSw_C) \times (nCbSh_C)</math> arrays predSamples<sub>Cb</sub> and predSamples<sub>Cr</sub>.</p> <p>ITU-T Rec. H.265 (12/2016) High efficiency video coding at pp. 142-44</p>
